Technical rescue incident response planning.

(1) Fire departments or a consortium of departments that choose to operate at the operations level or above must create a written special operations incident response plan for the specific type(s) of technical rescue at which they plan to operate at or above the operations level.

(2) When nonemergency resources may be required, procedures for acquisition of these resources for technical rescue incidents must be developed.

(3) Fire departments that choose to respond to chemical, biological, radiological, and nuclear (CBRN) incidents must provide training and equipment to all members expected to respond.
